

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (currently amended): A recording method comprising:
a step of changing a carry command value, when carrying a recording medium, according to a state of bending of said recording medium that is carried;
a step of driving at least one carry roller, which advances or withdraws said recording medium, based on said carry command value that has been changed; and
a step of recording on said recording medium that has been carried;
wherein the larger said carry command value is , the more said carry roller rotates.
2. (previously presented): A recording method comprising:
changing a carry command value, when carrying a recording medium, according to a state of bending of said recording medium that is carried;
carrying said recording medium based on said carry command value that has been changed; and
recording on said recording medium that has been carried;
wherein said carry command value is changed based on an aggregate carry amount that corresponds to a change in said state of bending.

3. (original): A recording method according to claim 1,
wherein said carry command value is changed when a front end region of said recording medium is carried and when a rear end region of said recording medium is carried.

4. (previously presented): A recording method comprising:
changing a carry command value, when carrying a recording medium, according to a state of bending of said recording medium that is carried;
carrying said recording medium based on said carry command value that has been changed; and
recording on said recording medium that has been carried;
wherein said carry command value is changed when a front end region of said recording medium is carried and when a rear end region of said recording medium is carried; and
wherein when said front end region is carried, said carry command value is changed to a larger carry command value than when said rear end region is carried.

5. (original): A recording method according to claim 1,
wherein said carry command value is changed according to an attribute of said recording medium.

6. (original): A recording method according to claim 5,
wherein an attribute of said recording medium is a thickness of said recording medium.

7. (original): A recording method according to claim 5,
wherein an attribute of said recoding medium is a length of said recording medium.
8. (original): A recording method according to claim 5,
wherein an attribute of said recoding medium is a width of said recording medium.
9. (original): A recording method according to claim 5,
wherein an attribute of said recoding medium is a material of said recording medium.
10. (previously presented): A recording method comprising:
changing a carry command value, when carrying a recording medium, according to a
state of bending of said recording medium that is;
carrying said recording medium based on said carry command value that has been
changed; and
recording on said recording medium that has been carried;
wherein said carry command value is changed according to an attribute of said recording
medium; and
wherein said carry command value is set according to
a predetermined reference carry command value, and
a correction value for said reference carry command value, said correction value
being associated in a data table with
an aggregate carry amount of said recording medium and

an attribute of said recording medium.

11. (original): A recording method according to claim 10,
wherein said data table is set for every predetermined carry amount of said recording
medium.

12. (original): A recording method comprising:
a step of changing a carry command value when carrying a front end region of a
recording medium and when carrying a rear end region of said recording medium, based on
a predetermined reference carry command value, and
a data table indicating correction values for said predetermined reference carry command
value, said correction values being set in association with a thickness, a length, a width, and a
material of said recording medium and being set for every predetermined carry amount of said
recording medium;
a step of making a carrying mechanism for carrying said recording medium carry said
recording medium based on said carry command value that has been changed; and
a step of recording on said recording medium that has been carried.

13. (currently amended): A computer-readable medium bearing program code
instructions, intended for use in making a recording apparatus perform operations, the recording
apparatus recording on a recording medium that is carried by a carrying mechanism, said
operations comprising:

driving at least one carry roller, which advances or withdraws said recording medium,
based on a carry command value; and

changing said carry command value, when said recording medium is carried, according to
a state of bending of said recording medium that is carried;

wherein the larger said carry command value is, the more the carry roller rotates.

14. (currently amended): A recording apparatus for recording on a recording medium,
comprising:

a carrying mechanism for advancing or withdrawing said recording medium within said
recording apparatus, wherein said carrying mechanism advances or withdraws said recording
medium based on a carry command value;

wherein said carry command value is changed according to a state of bending of said
recording medium that is carried; and

wherein the larger said carry command value is, the more the carrying mechanism
advances or withdraws said recording medium.

15. (currently amended): A recording method comprising:

a step of changing a carry command value when carrying a front end region of a
recording medium and when carrying a rear end region of said recording medium;

a step of making a carrying mechanism, which advances or withdraws said recording
medium, advance or withdraw said recording medium based on said carry command value that
had been changed; and

a step of recording on said recording medium that has been advanced or withdrawn;
wherein the larger said carry command value is, the more the carrying mechanism
advances or withdraws said recording medium.
